

How is the Structure of DNA related to its function?

- The sequence of bases acts as information storage in the form of codes to build proteins
- The molecules are long to store more information
- The base pairing means that complementary strands of information can be replicated
- The double helix gives the molecule stability
- Hydrogen bonds allow for easy unzipping for copying and reading information

models portray molecular properties in the thermodynamic limit and do not reflect the near term dynamic effects of such events. Developing accurate non equilibrium dynamic models is essential to understand these processes and to predict the length of time it will take the DNA molecule to relax to its equilibrium state. Our research has focused on developing a dynamic statistical mechanical model for predicting the mechanical behavior of DNA in a dynamic biological environment. We extend to a non equilibrium context the approach taken by Fye and Benham in their development of the equilibrium stress induced duplex destabilization SIDD model. This incorporates an Ising like framework to model the DNA molecule and predicts the equilibrium destabilization free energy and probability of denaturation for each base pair in the molecule. The non equilibrium properties of the traditional one dimensional kinetic Ising model have been thoroughly studied and we have leveraged these results in developing our approach. Our model is implemented as a time dependent simulation using Glauber dynamics. The master equation developed here allows us to introduce complexities not seen in previous non equilibrium statistical mechanical studies of the DNA molecule. The global coupling of the base pairing in the model induces physics that have not heretofore been employed in studying dynamic models of DNA. Among the measures calculated are the time series probability distributions, time dependent energies of opening and probabilities of opening for each base pair of the DNA molecule. Scenarios of transcription and protein binding are simulated using the model as a dynamic bioinformatics tool. An example of how to use the information in the superhelical stress profiles to identify features of the DNA molecule is presented. Our dynamic approach thus enables a more accurate modeling of DNA regulatory mechanisms in the cell and of the various functions of DNA in vivo.
