How is genetic information stored and copied?

## Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

Conversely ageing may be associated with loss of replication activity and restoring it to cells may moderate some of the diseases associated with old age Replication is therefore fundamental to a huge range of molecular biological and biochemical applications and provides many potential targets for drug design The fast pace of replication research particularly in providing new structural insights has outdated the majority of available texts This learned yet accessible book contains the latest research written by those conducting it It examines conserved themes providing a biological background for biochemical chemical and pharmaceutical studies of this huge and exciting field Rather than simply itemising the replication steps and the proteins involved replication is tackled from a novel perspective The book provides logical groupings of processes based upon biochemical similarities The emphasis on mechanisms and the relationship between structure and function targets the chapters towards biochemists and biological chemists as well as molecular and cell biologists The book highlights new insights into the replication process from the assembly of pre replication complexes through polymerisation mechanisms to considering replication in the context of chromatin and chromosomes It also covers mitochondrial DNA replication and includes archaeal paradigms which are proving increasingly relevant to the study of replication in higher eukaryotes Exciting potential drug targets in DNA replication are discussed particularly in the context of treating malaria and cancer
