Dynamic Fleet Management Vasileios S. Zeimpekis, Christos D. Tarantilis, George M. Giaglis, Ioannis E. Minis, 2007-10-05
Dynamic Fleet Management will focus on real time management of a distribution system This means that when a dynamic event occurs within the distribution chain action must be taken in real time The book will integrate the latest results in system design algorithm development and system implementation to capture the state of the art research and application trends While much of the research in this area of transportation problems have almost exclusively concentrated on carrying out static plans on optional distribution conditions this book will examine those problems when some dynamic or unplanned even occurs within the transport or network system It will focus specifically on these cases and integrate the latest results in systems routing algorithms and case studies where information a dynamic event is revealed to the decision maker in a real time manner

Dynamic Fleet Management for International Truck Transportation Steffen Schorpp, 2011-05-19 Two new dynamic planning approaches incorporating all important real life restrictions such as regulations on driving and working hours are developed and evaluated Extensive numerical tests are carried out with a five week real life data set from an international freight forwarding company

Dynamic Fleet Management for Autonomous Vehicles Breno Alves Beirigo, 2021 Autonomous vehicles AVs have been heralded as the key to unlock a shared mobility future where transportation is more efficient convenient and cheaper However the AV utopia can only come to fruition if the majority of users trust that autonomous mobility on demand AMoD systems are on a par with owning a vehicle in terms of service quality Once the perception of quality is highly subjective we propose a more personalized approach to on demand mobility in which

users are segmented into service quality classes These classes comprise minimum requirements regarding responsiveness and privacy allowing us to model a series of user profiles formalized using strict service quality contracts By honoring these contracts providers can build users trust and gain their loyalty which on a grander scheme can contribute to a faster transition to a shared mobility future This thesis presents a series of strategies to guaranteeing service quality throughout operational scenarios arising in the timeline of AV technology deployment First a precondition to providing service quality in autonomous transportation is safety During a transition phase to full automation AV operation will likely be restricted to areas where safe operations are guaranteed leading to the formation of hybrid street networks comprised of autonomous and non autonomous vehicle zones In this setting meeting user service quality expectations is primarily a matter of coverage once mobility services will have to access both AV ready and not AV ready areas Accordingly this thesis proposes solutions to overcome the challenges entailed by such a transition scenario where infrastructures regulatory measures and AV technology are gradually evolving Then assuming that widespread automated driving is the new status quo we set out to model rich autonomous transportation scenarios comprised of heterogeneous users and vehicles Central to our analysis is finding an adequate trade

Pro-active Dynamic Vehicle Routing Francesco Ferrucci, 2013-03-14 This book deals with transportation processes denoted as the Real time Distribution of Perishable Goods RDOPG The book presents three contributions that are made to the field of transportation First a model considering the minimization of customer inconvenience is formulated Second a pro active real time control approach is proposed Stochastic knowledge is generated from past request information by a new forecasting approach and is used in the pro active approach to guide vehicles to request likely areas before real requests arrive there Various computational results are presented to show that in many cases the pro active approach is able to achieve significantly improved results Moreover a measure for determining the structural quality of request data sets is also proposed The third contribution of this book is a method that is presented for considering

driver inconvenience aspects which arise from vehicle en route diversion activities Specifically this method makes it possible to restrict the number of performed vehicle en route diversion activities

Ben-Akiva, Hilde Meersman, Eddy Van de Voorde, 2013-05-14 This title addresses the need to develop new freight transport models and scientific tools to provide sound solutions that consider the wide range of internal and external impacts The international contributions push forward frontiers in freight transport modelling and analysis

Anticipatory Optimization for Dynamic Decision Making Stephan Meisel, 2011-06-23 The availability of today's online information systems rapidly increases the relevance of dynamic decision making within a large number of operational contexts Whenever a sequence of interdependent decisions occurs making a single decision raises the need for anticipation of its future impact on the entire decision process Anticipatory support is needed for a broad variety of dynamic and stochastic decision problems from different operational contexts such as finance energy management manufacturing and transportation Example problems include asset allocation feed in of electricity produced by wind power as well as scheduling and routing All these problems entail a sequence of decisions contributing to an overall goal and taking place in the course of a certain period of time Each of the decisions is derived by solution of an optimization problem As a consequence a stochastic and dynamic decision problem resolves into a series of optimization problems to be formulated and solved by anticipation of the remaining decision process However actually solving a dynamic decision problem by means of approximate dynamic programming still is a major scientific challenge Most of the work done so far is devoted to problems allowing for formulation of the underlying optimization problems as linear programs Problem domains like scheduling and routing where linear programming typically does not produce a significant benefit for problem solving have not been considered so far Therefore the industry demand for dynamic scheduling and routing is still predominantly satisfied by purely heuristic approaches to anticipatory decision making Although this may work well for certain dynamic decision problems these approaches lack transferability of findings to other related problems This book serves two major purposes It provides a comprehensive and unique view of anticipatory optimization for dynamic decision making It fully integrates Markov decision processes dynamic programming data mining and optimization and introduces a new perspective on approximate dynamic programming Moreover the book identifies different degrees of anticipation enabling an assessment of specific approaches to dynamic decision making It shows for the first time how to successfully solve a dynamic vehicle routing problem by approximate dynamic programming It elaborates on every building block required for this kind of approach to dynamic vehicle routing Thereby the book has a pioneering character and is intended to provide a footing for the dynamic vehicle routing community

Network Routing Michael O. Ball, 1995-10-30

The papers in this volume consider a general area of study known as network routing The underlying problems are conceptually simple yet mathematically complex and challenging How can we best route material or people from one place to another Or how can we best design a system for instance locate facilities to provide services and goods as efficiently and equitably as possible The problems encountered in answering these questions often have an underlying combinatorial structure for example either we dispatch a vehicle or we do not or we use one particular route or another The problems also typically have an underlying network structure a communication or transportation network In addition models for these problems are often very large with hundreds or thousands of constraints and variables A companion volume in the Handbook series entitled Network Models treats basic network models such as minimum cost flows matching and the travelling salesman problem as well as several complex network topics not directly related to routing such as network design and network reliability

Transportation and Information Piyushimita (Vonu) Thakuriah, D. Glenn Geers, 2013-06-18

Transformations in wireless connectivity and location aware technologies hold the promise of bringing a sea change in the way transportation information is generated and used in the future Sensors in the transportation system when integrated with those in other sectors for example energy utility and health have the potential to foster novel new ways of improving livability and sustainability The end result of these developments has been somewhat contradictory Although automation in the transportation environment has become increasingly widespread the level of involvement and active participation by

people in terms of co creation and contribution of information has also increased As a result the following two major trends have been observed 1 increases in Machine to Machine M2M communications and 2 increases in the variety and volume of User Generated Content In this transportation paradigm the pervasive use of Information and Communication Technologies will serve as the foundation for mobility intelligence towards an ubiquitous information centered mobility environment However many technical and operational questions as well as social management and legal challenges present themselves in the transformation to this vision The book presents a non technical review of research and initiatives and a discussion of such opportunities and challenges Fleet Management and Logistics Teodor G. Crainic, Gilbert Laporte, 2012-12-06 TEODOR GABRIEL CRAINIC DIRECTOR The Centre for Research on Transportation C R T was founded in 1971 by the Universite de Montreal From 1988 on it is jointly managed by the Universite de Montreal and its affiliated schools the Ecole des Hautes Etudes Commerciales and Ecole Poly technique Professors students and researchers from many institutions in the Montreal area join forces at the C R T to analyze transportation logistics and telecommunication systems from a multidisciplinary perspective The C R T pursues three major complementary objectives training of high level specialists the advancement of knowledge and technology the transfer of technology towards industry and the public sector Its main field of expertise is the develop ment of quantitative and computer based models and methods for the analysis of urban regional and intercity transportation networks as well as telecommunication systems This applies to the study of passenger and commodity flows as well as to the socioeconomic aspects of transportation policy regulation economics The twenty fifth anniversary of the C R T offered the opportunity to evaluate past accomplishments and to identify future trends and challenges Five colloquia were thus organized on major research and application themes that also reflected our main research areas They gathered together internationally renowned researchers who linked recent scientific and technological advances to modeling and methodological challenges waiting to be tackled particularly concerning new problems and applica tions and the increasingly widespread use of new technologies TIMS/ORSA Bulletin Institute of Management Sciences, 1992
