Dynamic Models of Infectious Diseases Vadrevu Sree Hari Rao, Ravi Durvasula, 2013-12-31 Dynamic Models of Infectious Diseases V. Sree Hari Rao, Ravi Durvasula, 2013-11-30 Though great advances in public health are witnessed world over in recent years infectious diseases besides insect vector borne infectious diseases remain a leading cause of morbidity and mortality Control of the epidemics caused by the non vector borne diseases such as tuberculosis avian influenza H5N1 and cryptococcus gattii have left a very little hope in the past The advancement of research in science and technology has paved way for the development of new tools and methodologies to fight against these diseases In particular intelligent technology and machine learning based methodologies have rendered useful in developing more accurate predictive tools for the early diagnosis of these diseases In all these endeavors the main focus is the understanding that the process of transmission of an infectious disease is nonlinear not necessarily linear and dynamical in character This concept compels the appropriate quantification of the vital parameters that govern these dynamics This book is ideal for a general science and engineering audience requiring an in depth exposure to current issues ideas methods and models The topics discussed serve as a useful reference to clinical experts health scientists public health administrators medical practitioners and senior undergraduate and graduate students in applied mathematics biology bioinformatics and epidemiology medicine and health sciences **Proceedings of the Future Technologies Conference (FTC) 2021, Volume 2** Kohei Arai, 2021-11-03 This book covers a wide range of important topics including but not limited to Technology Trends Computing Artificial Intelligence Machine Vision Communication Security e Learning and Ambient Intelligence and their applications to the real world The sixth Future Technologies Conference 2021 was organized virtually and received a total of 531 submissions from academic pioneering researchers scientists industrial engineers and students from all over the world After a double blind peer review process 191 submissions have been selected to be included in these proceedings One of the meaningful and valuable dimensions of this conference is the way it brings together a large group of technology geniuses in one venue to not only present breakthrough research in future technologies but also to promote discussions and debate of relevant issues challenges opportunities and research findings We hope that readers find the book interesting exciting and inspiring it provides the state of the art intelligent methods and techniques for solving real world problems along with a vision of the future research **Neoliberal Ebola** Robert G. Wallace, Rodrick Wallace, 2016-08-29 This volume compiles five papers modeling the effects of neoliberal economics on the emergence of Ebola and its aftermath Neoliberalism is currently the world's primary economic philosophy It centers international relations around globalizing laissez faire economics for multinational companies promoting free trade deregulating economic markets and shifting state expenditures in favor of private property The multidisciplinary teams represented here place both Ebola Makona the Zaire Ebola virus variant that has infected 28 000 in West Africa and Ebola Reston which is currently emerging in industrial hog farms in the Philippines

and China within a multi plank modeling framework Using a stochastic extinction model that one group spatializes environmental stochasticity across the ecologies in which Ebola evolves is treated as an ecosystemic prophylaxis An agroecological logic gate is developed for epidemic control A Black Scholes model explicitly links economic margins across agricultural systems to success in biocontrol This new control theory is further developed around the data rate and rate distortion theorems a turbulence model and cognitive symmetry breaking Lastly a model of pandemic penetrance is used to explore the domino effects of serious outbreaks amplifying through the cascades of disasters that can follow deadly pandemics All the models presented are contextualized by socioeconomic geographies specific to outbreak locales Together the models suggest shifts in regional agroecoeconomics under the neoliberal doctrine driving deforestation and monoculture production destroying the ecosystemic friction with which local forests typically disrupt Ebola transmission The resulting collapse in such an ecological function accelerates pathogen spillover and propagation across the remaining host populations The failure on the part of current control efforts to assimilate such a structural context may render even an efficacious vaccine dysfunctional The authors propose an alternate science of disease and an adjunct program of interventions useful to researchers and public health officials alike
